

Importing the Dataset

Vayu Air · load the source data before you start

What you'll do

You'll load the six source CSV files in the `data/` folder into SQL Server as bronze tables. The recommended route is the Import Flat File wizard; a scripted BULK INSERT alternative is also provided. You will build the warehouse (dw) tables yourself in the assignment.

Note This assumes SQL Server and SSMS are already installed and connected. If not, follow the SQL Server and SSMS setup guide first.

Step 1: Create the database

1. Open SSMS and connect to your server (for a local install the server name is `localhost`).
2. In a new query window, run:

```
CREATE DATABASE VayuAir;
```

3. Right-click **Databases** in Object Explorer and choose **Refresh**.

Step 2, Option A: Import Flat File wizard (recommended)

Do this once per CSV. The wizard reads the header row, names the table after the file, and infers the column types.

1. Expand **Databases**, right-click **VayuAir**, and choose **Tasks** → **Import Flat File...**
2. Click **Browse**, pick one CSV from `data/` (for example `bronze_bookings.csv`), and click **Next**.
3. Confirm the **table name** matches the file name (for example `bronze_bookings`) and click **Next**.
4. On the **Modify Columns** screen, glance over the detected types, then click **Next** and **Finish**.
5. Repeat for all six files: `bronze_airports`, `bronze_aircraft`, `bronze_passengers`, `bronze_flights`, `bronze_bookings`, `stg_passenger_updates`.

Step 2, Option B: BULK INSERT (scripted alternative)

1. Copy the CSVs to a folder the SQL Server service can read, for example `C:\cb_data\`.
2. Open `data/load.sql`, make sure it begins with `USE VayuAir;`, and update the file paths in the `BULK INSERT` lines.
3. Run the script.

Warning BULK INSERT reads files from the server's file system and the service account needs permission to that folder. If you hit a permission error, use the Import Flat File wizard in Option A instead.

Step 3: Confirm the load

Run this row-count check. The numbers on the right are what you should see.

```
USE VayuAir;
SELECT 'bronze_airports'          AS table_name, COUNT(*) AS rows FROM
bronze_airports
UNION ALL SELECT 'bronze_aircraft',      COUNT(*) FROM bronze_aircraft
UNION ALL SELECT 'bronze_passengers',    COUNT(*) FROM bronze_passengers
UNION ALL SELECT 'bronze_flights',      COUNT(*) FROM bronze_flights
UNION ALL SELECT 'bronze_bookings',     COUNT(*) FROM bronze_bookings
UNION ALL SELECT 'stg_passenger_updates', COUNT(*) FROM stg_passenger_updates;
```

table_name	expected rows
bronze_airports	24
bronze_aircraft	10
bronze_passengers	1,500
bronze_flights	2,000
bronze_bookings	40,000
stg_passenger_updates	250

If every count matches, you're ready to open the Assignment Questions and start building the warehouse.
